

A FORTRAN PROGRAM FOR COMPUTING PRIMARY INSURANCE AMOUNTS

by Steven F. McKay, F.S.A.
Office of the Actuary

Estimates of the actuarial status of the Old-Age, Survivors, and Disability (OASDI) system are made by projecting numbers of beneficiaries by beneficiary category, and by projecting benefit amounts for those same categories. The overall methodology underlying the long-range (75-year) cost estimates is explained in Actuarial Study No. 83: Long-Range Cost Estimates for Old-Age, Survivors, and Disability Insurance System, 1980 by Steven F. McKay. Details of the population projections underlying the projected numbers of beneficiaries are contained in Actuarial Study No. 85: Social Security Area Population Projections, 1981 by Joseph F. Faber and John C. Wilkin. Details of the long-range projection of benefit amounts are contained in Actuarial Note No. 108: Long-Range Projection of Average Benefits Under OASDI by Steven F. McKay.

To project OASDI average benefits for long-range cost estimates and for other purposes, the Office of the Actuary prepares computer programs to perform most of the calculations. In the past, some of those programs have been published (see Actuarial Note No. 80: Some Mathematical Aspects of the Social Security Amendments in Public Law 92-603 by Albert Rettig and Orlo R. Nichols and Actuarial Note No. 85: Changes in Social Security Benefits Under Public Law 93-233 by Albert Rettig and Orlo R. Nichols). Those published programs have not been republished in updated form over the past few years primarily because of the complications introduced by the 1977 Amendments to the Social Security Act. Prior to those amendments, it was possible to find most PIA's in one table which related an average monthly wage (AMW) to the PIA's. The 1977 Amendments introduced a wage-indexed method of computing a PIA, as well as a transitional-guarantee method to smooth the transition to the wage-indexed method. Because of the amendments, various PIA calculation methods apply to various groups of people, depending on factors such as age, earnings levels, and type of benefit. Although no computer program had been published covering these PIA calculation methods, they were explained in detail in Actuarial Note No. 100: Computing a Social Security Benefit After the 1977 Amendments by Steven F. McKay, Actuarial Note No. 111: Computing a Social Security Benefit After the 1980 and 1981 Amendments by Steven F. McKay, and Actuarial Study No. 86: Effects of the Various Social Security Benefit Computation Procedures by Steven F. McKay and Bruce D. Schobel.

The computer program in this Note implements the language of Actuarial Note No. 111. It is designed to serve many purposes, and so at first glance may appear lengthy. However, of the 1614 lines, 708 are comments, leaving 906 lines of program code. Amounts calculated by those 906 lines include the number of

Office of the Actuary
SSA Pub. No. SSA 11-11500
December 1982

elapsed years and computation years, the AMW and/or average indexed monthly earnings (AIME), any of the applicable PIA's (the old-start PIA, the special-minimum PIA, the PIA table PIA, the transitional guarantee PIA, and the wage-indexed PIA), and the corresponding Maximum Family Benefit (MFB). The PIA can be computed for most cases of retirement, disability, or death, whether past or present. Future benefits can be projected by specifying certain assumptions as to future average wage and CPI increases and future earnings bases.

The program is set up as a FORTRAN subroutine requiring approximately 8,000 words of storage when the parameters are as specified on line 227. It is largely written in segments. For instance, the old-start calculation is on lines 405 through 812. For many purposes, the old-start calculation is unimportant, so in those cases, by deleting lines 405 through 812 and by making a few other changes, the program can be considerably shortened without loss. Other simplifications are possible, such as elimination of all code concerning MFB calculations.

Although, with the addition of a calling program, the subroutine may be used as written, its greatest use is probably as a source of information concerning PIA calculations. It is not the same program as that used in the actual benefit operations of the Social Security Administration; there may be differences between the results produced by this program and a similar calculation performed for an actual benefit calculation. However, for most purposes this program should be sufficient.

The first 216 lines of the subroutine are comments describing how to use it and definitions of the variables in the subroutine. As an additional aid to understanding the programming, a short program which calls the subroutine is presented on the next page. The program produces the PIA for a male retiring at age 65 years and no months (the PIA for a female would be the same); date of birth is December 15, 1917; earnings are above the maximum in each year from 1937 to 1981. The result is \$752.50, the maximum PIA for a retiree at age 65 in 1982 after the June 1982 benefit increase (assuming no period of disability).

Sample Program to Call PIA Calculation Subroutine

```

1:      PARAMETER IY=110,IX=IY+14,IZ=IY-31,IW=IY-32,IV=IY-33,MAXYRS=65
2:      DIMENSION AW82(IZ), BINC83(IW), EARNST(MAXYRS),
3:      &FTEARN(5), IAGE(2), IAME(5), IAPP(5),
4:      &IBAS84(IV), IBENDM(4), IBENDP(3), IBIRTH(3), IDO(2),
5:      &IENT(2), IORDER(5,IX), ISPMIN(IX), PAIME(3),
6:      &PAMEOS(2), PERCM(4), PERCP(3), PIA(5), PIAEL(5),
7:      &PPIAEL(4,5), VEARN(5,IX)
8:      REAL MFB(5), MFBEL(5)
9:      DOUBLE PRECISION UEARN(IX)
10:     IAGE(1)=65
11:     IAGE(2)=0
12:     ISEX=1
13:     IBIRTH(1)=12
14:     IBIRTH(2)=15
15:     IBIRTH(3)=1917
16:     IBEGIN=1937
17:     IEND=1981
18:     IOASDI=0
19:     DO 10 I=1937,1981
20: 10 EARNST(I-1936)=50000.00
21:     CALL ANYPIA ( IAGE, ISEX, IBIRTH, IBEGIN, IEND, IOASDI, IDO, EARNST,
22:     1AW82,BINC83,IBAS84,
23:     2HIPIA,PIA,

30:     WRITE (6,20) HIPIA
31: 20 FORMAT (' THE PIA IS:',F8.2)
32:     END

```

Output from this program:

THE PIA IS: 752.50

1:CC
2:C
3:C This subroutine computes the PIA (Primary Insurance Amount) and
4:C MFB (Maximum Family Benefit) under the applicable computation and
5:C methods for most cases of benefit award, whether past, present,
6:C or projected. This is not the same program used in Social
7:C Security benefit operations; it is used solely for cost-estimating
8:C purposes in the Office of the Actuary.
9:C
10:C The following are specifically considered:
11:C
12:C 1. Retirement, survivors, or disability case.
13:C 2. Male or female worker.
14:C 3. Date of birth.
15:C 4. Age in years and months at retirement.
16:C 5. Date of death or disability.
17:C 6. Projected benefit increases, average wages, and wage bases
18:C for projected benefits.
19:C 7. All rounding rules.
20:C 8. Actual average wages through 1981, actual benefit increases
21:C through June 1982, and actual wage bases through 1983.
22:C All amendments to the Social Security Act through December, 1982
23:C
24:C The following are some of the limitations:
25:C
26:C 1. Some approximations are made in the benefit calculations for
27:C entitlements prior to 1961.
28:C 2. Periods of disability freeze are not considered.
29:C 3. Some approximations are made in the \$122 frozen minimum PIA
30:C calculation.
31:C 4. No distinction is made between initial awards and benefit
32:C recomputations. This is generally a problem only for initial
33:C entitlements prior to 1961.
34:C 5. Any applicable insured status requirement is assumed to be met.
35:C
36:C The "SUBROUTINE" statement on line 218 consists of 9 lines: the first
37:C one (line 0) and 8 continuation lines (lines 1 to 8). Each line of
38:C the SUBROUTINE statement contains a related group of variables:
39:C
40:C 0. User-assigned variables necessary in all cases.
41:C 1. User-assigned variables necessary only for projected benefits.
42:C 2. PIA's returned from subroutine.
43:C 3.-5. Detail variables applying to more than one method.
44:C 6. Detail variables applying to Old-Start method.
45:C 7. Detail variables applying to Wage-Indexed method.
46:C 8. Detail variables applying to Special-Minimum PIA method.
47:C
48:C The variables are explained in the "Definition of Variables"
49:C section. When calling the subroutine, be sure to match variable
50:C type and dimension.
51:C
52:C Two parameters should be set by the user: IY is the most future
53:C year of entitlement that may be considered, minus 1950 (minimum
54:C 33, since some historical figures extend through 1983). MAXYRS

109:C *IB = wage base in year 1936 + I.
 110:C *IBAS84 = wage bases supplied by user, 1984 to 1936+IX.
 111:C IBEGIN = beginning year of earnings used (4 digits).
 112:C *IBENDM = bend points for MFB formula under 1977 Act (0 if not applicable).
 113:C
 114:C *IBENDP = bend points for PIA formula under Wage-Indexed method (0 if not applicable).
 115:C
 116:C *IBIRTH = month, day, and year of birth (year is 4 digits).
 117:C *IB77 = wage base ignoring 1979-81 ad hoc increases in year 1936+I.
 118:C ICAP = disability Maximum Family Benefit cap indicator (=0 for no cap, =1 for 1.5*PIA cap, =2 for .85*AIME cap, =3 for 1.0*PIA floor).
 120:C
 121:C IDIVOS = divisor for 1977 Old-Start.
 122:C *IDO = month and year of disability onset if IOASDI=2, or death, if IOASDI=1; meaningless if IOASDI=0 (year is 4 digits).
 123:C
 124:C IELGYR = year prior to year of eligibility minus 1950 (minimum of 0).
 125:C IEEND = last year of earnings used (4 digits).
 126:C *IENT = month and year of entitlement (year is 4 digits).
 127:C IERNYR = year prior to year of retirement or disability, or exact year of death, minus 1950 (last year of earnings considered).
 129:C
 130:C IERN50 = initial year of earnings minus 1950 (minimum 1).
 131:C IOASDI = 0 for old-age, 1 for survivor, 2 for disability.
 132:C *IORDER = 1 for year I if earnings in year I are among highest N;
 133:C I=1 to 5 is method number, J is year-1936 for I=1,
 134:C otherwise year-1950.
 135:C ISEX = sex of wage earner (1=male, 2=female).
 136:C *ISPMIN = 0 if not year of coverage, 1 if year of coverage, in year
 137:C 1936+I.
 138:C ISPMNT = total number of years of coverage in Special Minimum,
 139:C including those less than 10 and more than 30.
 140:C ITABEL = index of applicable PIA Table (1 is 1952 Act, 2 is 1954
 141:C Act, 3 is 1958 Act, 4 is 1965 Act, 5 is 1967 Act, 6
 142:C is 1969 Act, 7 is 1971 Act, 8 is 1972 Act, 9 is 1973
 143:C Act, 10 is 1977 Act).
 144:C IV = last year of period minus last year of actual earnings
 145:C base.
 146:C IW = last year of period minus last year of actual benefit
 147:C increase.
 148:C IX = last year of period minus 1936.
 149:C IY = last year of period minus 1950.
 150:C IYCPI1 = number of years for which benefit increases are applied
 151:C to PIA-Table PIA and 1977 Old-Start PIA for eligibility
 152:C in 1978.
 153:C IYCPI2 = number of years for which benefit increases are applied
 154:C to Wage-Indexed PIA, Transitional-Guarantee PIA, and
 155:C 1977 Old-Start PIA for eligibility in 1979 or later.
 156:C TYRSPM = number of years of coverage in Special Minimum in excess of
 157:C 10, up to 30.
 158:C *IZ = last year of period minus last year of actual average
 159:C earnings.
 160:C I1 = temporary index used in various places.
 161:C I2 = temporary index used in various places.
 162:C MAXYRS = maximum number of years of earnings, or implied earnings,
